

Determining the optimal location of wind turbines for a wind power plant

Idea of the project to try to determine optimal location of turbines

It can increase profit and efficiency of using wind generated power, which can replace more power generated by fossil sources. Fossil usage heavily affects the environment, and decreasing in usage of energy generated that way can have positive consequences, such as smaller CO2 waste.

AI tool used for the project is hill climb algorithm

Other tools - Keras library for NN, perceptron architecture, backpropagation error
